PREFACE

This is a report of vital statistics regarding births that occurred to Indiana residents in 1987. Indiana had 78,515 live resident births with a rate of 14.2 per 1,000 population. This was a decrease from 1986 which had 79,269 births with a rate of 14.4.

The purpose of this report is to present this data recorded from the filing of birth certificates.

Questions regarding information included in this report should be referred to:

Division of Public Health Statistics
Bureau of Policy Development
Indiana State Board of Health
1330 W. Michigan Street
Indianapolis, IN 46206-1964.

1987 INDIANA NATALITY REPORT

INDIANA VS. UNITED STATES

From 1960 to the present, Indiana's birth rates have declined from 24.1 to 14.2 per 1,000 population. Indiana's 1987 births are 34,196 less than what they were in 1960. There is a 30 percent drop in the number of Indiana births from 112,711 to 78,515, whereas the U.S. number of births dropped almost 10 percent from 4,244,796 to 3,809,394. Indiana's rate dropped almost 41 percent, while the U.S. rate dropped 35 percent. Until 1981, Indiana had slightly higher birth rates than the United States. Starting in 1981, Indiana had a lower number crude birth rates than the United States. (See Table 1.) This trend is graphically shown in Figure 1.

Table 2 shows the fertility rates adjusted to the 1980 population. With the exception of 1980, the age-sex adjusted rate is higher than the crude rate because the United States's population of child-bearing age groups that year was higher than that of Indiana.

BIRTH RATES

The white and nonwhite birth rates per county and city are shown on Table 3 and Table 3-A.

The following table shows the top five and lowest five counties for crude birth rates:

TOP FIVE	RATE*	LOWEST FIVE	RATE*
LaGrange	19.9	Monroe	11.0
Adams	18.3	Parke	11.0
Marion	17.0	Sullivan	11.0
Elkhart	17.0	Knox	11.1
Miami	16.7	Lawrence	11.2

*Rate per 1,000 population
Source: Indiana State Board of Health, Public Health Statistics Division, 1990.

Map 1 features Indiana birth rates and graphically displays them on a State map.

Table 4 gives the 1987 births and birth rates by month. September had the highest rate of 15.2, while January had the lowest rate of 12.7 births per 1,000 population.

MOTHERS WHO LIVED IN URBAN AREAS

Almost seventy percent of births in Indiana occurred to women who lived in urban areas. Of the females under the age of 15 who gave birth, almost eighty-one percent of them lived in urban areas. For women, ages 15-19, 69 percent of them lived in urban areas while 66.2 percent of women ages 20-24 also lived in urban areas. Almost 70 percent in the 25-29 age group who gave birth lived in urban areas. Seventy-four percent of women ages 30-34 and almost 68 percent of women ages 35-44 lived in urban areas while 55.0 percent of women over the age of 45 who gave birth in 1987 also lived in urban areas. Approximately sixty-eight percent of the total population lived in the thirty counties that are considered as urban., (See Table 6.)

BIRTH ORDER

In 1987, 32,091 births, or 40.8 percent of the total, were first births; and 26,654 births, or 33.9 percent, were second births. (See Table 7.)

APGAR SCORES

The Apgar scoring method consists of five vital signs--heart rate, respiratory effort, muscle tone, reflex irritability, and color. These signs are observed at exactly 1 minute after complete birth of the infant. Each sign is evaluated according to the degree to which it is present and is given a score of 0, 1, or 2.

The five scores, one given to each of the five signs, are added together for a total score. It ranges from 0 to 10. An infant in excellent condition could receive the maximum score of 10, and one in poor condition would receive a very low total score, possibly even 0. Total scores of 0 to 3 represent severe distress, scores of 4 to 6 signify moderate difficulty, and scores of 7 to 10 indicate absence of difficulty in adjusting to life.

In 1987, 5,259 of the 78,515 births (or 6.7 percent) in Indiana had Apgar scores of under 6 at one minute. Looking at the racial breakdown, 4,477 of the 69,864 white births (or 6.4 percent) had Apgar scores of under 6 at one minute, and 782 of the 8,650 (or 9.0 percent) nonwhite births had Apgar scores under 6 at one minute. (See Table 9.)

At the five-minute level, only 777 births had Apgar scores of under 6--which is 1.0 percent. Looking at the white births, only 622 (or 0.9 percent) had Apgar scores under 6, while 155 (or 1.8 percent) of the nonwhite births had scores under 6. (See Table 10.)

Thirty-five percent of all births had an Apgar score of 8 at one minute and 9 at five minutes. Over seventy-one percent of the births had scores of at least 8 on both the one-minute and five-minute mark.

Table 11 gives the Apgar scores at one minute by age of mother. For those under age fifteen, 17 of the 178 known scores (or 9.5 percent) had Apgar scores of less than 6 at one minute. Women, ages 25-29, had the lowest percentage of scores under 6 at one minute for 6.4 percent (1,541 of 24,159 known scores).

MOTHER'S EDUCATON

Table 12 consists of the number of live births by marital status, by race, and by mother's education in Indiana in 1987. Figure 2 shows this graphically.

PRENATAL VISITS

Prenatal care is important to the well-being of the mother as well as the unborn fetus. It is designed to meet the physical, social, and emotional needs of women and their families during pregnancy. It is also effective in preventing low birth weight infants and reducing infant mortality.

The greatest impact of prenatal care is on the neonatal mortality rate. To be effective, prenatal care must be comprehensive, and it should begin in the first trimester and continue at regular intervals for the duration of pregnancy.

The percentage of women in the State overall who received at least six prenatal visits slightly increased by one percent from 1986. Six prenatal visits was chosen for minimally adequate prenatal care because that is the average number of prenatal visits with a normal pregnancy.

In 1987, more than fifteen percent of the teenagers who gave birth had inadequate prenatal care. Almost twenty five percent of the nonwhite teenage mothers had inadequate prenatal care, while twelve percent of the white teenage mothers who gave birth had inadequate prenatal care. (See Tables 13, 14 and 15.)

HOSPITAL BIRTHS

Ninety-nine percent of live births occurred in hospitals. Seventy-four percent of the hospital births occurred in the county of residence. Adams County had the lowest percent of hospital births with 84.5 percent. (See Table 16.)

The following is a table of number of live births by selected hospitals (See Table 29):

TOP FIVE HOSPITALS	TOTAL
Methodist Hospital of Indianapolis	3,772
St. Vincent Hospital	3,512
Parkview Memorial Hospital, Inc.	3,245
Memorial Hospital of South Bend	3,159
Wishard Memorial Hospital	3,009

BOTTOM FIVE HOSPITALS	TOTAL
Jennings Community Hospital	1
Warrick Hospital	2
St. Joseph Medical Center (St. Joseph County)	8
St. Mary Medical Center	9
University Heights(Community South)	30

Source: Indiana State Board of Health, Public Health Statistics Division, 1990.

LOW BIRTH WEIGHT

Indiana and the United States' low birth weight rates have fluctuated slightly since 1960. The rates have increased by almost two percent for Indiana however, and one percent for the United States in 1987 compared to 1986.

The following table indicates the top five and lowest five counties with low birth weight rates:

TOP FIVE	RATE*	LOWEST FIVE	RATE*
Crawford	116.8	Gibson	27.0
Benton	87.3	Randolph	28.3
Brown	83.8	Ohio	30.3
Newton	83.3	Adams	31.9
Switzerland	81.4	Noble	32.1

*Rate per 1,000 Live Births
Source: Indiana State Board of Health, Public Health Statistics Division, 1990.

Table 17 gives the number and rate of low birth weight infants for Indiana and the United States. Figure 3 shows the comparison of Indiana and the United States.

Table 18 and 18A show the total number and rates of low birth weight infants, by race, by county, and by city. (See Map 2 and Table 8 also.)

Table 19 gives the number of low birth weight infants and rates by age and race of mother. Females under the age of 15 had the highest low birth weight rate (145.8 per 1,000 live births), while women ages 25-29 had the lowest rate (56.1).

White females, under the age of 15, had a rate of 119.6 per 1,000 live births; nonwhites in this same age group had a rate of 170.0.

MARITAL STATUS

Since 1960, the out-of-wedlock birth rate has increased by 453 percent. The white rate has increased by 547 percent, and the nonwhite rate has increased by 236 percent. In 1987, the nonwhite rate was four times as high as the white rate. Figure 4 shows the increase and the difference between the white and nonwhite rates. (See Table 20 and Figure 4.)

In 1987, Indiana had an out-of-wedlock rate of 221.3 per 1,000 live births. The white out-of-wedlock rate was 166.2, while the nonwhite rate was 666.6.

The following table lists the top five and lowest five counties with out-of-wedlock rates:

TOP FIVE	RATE*	LOWEST FIVE	RATE*
Lake	347.4	Dubois	69.4
Marion	328.8	Spencer	74.6
Grant	311.9	Adams	84.8
Madison	287.0	Hendricks	88.4
Wayne	267.7	Boone	89.2

*Per 1,000 Live Births
Source: Indiana State Board of Health, Public Health Statistics Division, 1990.

Map 3 shows the total out-of-wedlock rates for each county. (See Tables 21 and 21A.)

In 1987, the females under the age of 15 had the highest out-of-wedlock rate of 963.5 per 1,000 live births. The rate for whites in this age group was 934.8, while the nonwhite rate was 990.0 per 1,000 live births. The lowest out-of-wedlock rate was in the 30-34 year-old age group with 78.6 per 1,000 live births. For the white population, the lowest rate was in the 30-34 year-old age group with a rate of 54.2; for the nonwhite population, the lowest rate was in the 40-44 age group with a rate of 301.9. (See Tables 22 and 23.)

FERTILITY RATES

Age of Mother

In 1987, the most births occurred to women ages 25-29, followed by women ages 20-24. Over sixty-two percent of births occurred to women in these two age groups. For the white population, over sixty-three percent occurred in women ages 20-24 and 25-29, while only fifty-five percent occurred in these two age groups in the nonwhite population.

Table 24 gives the fertility rates for selected years from 1960 to 1987. Since 1960, the fertility rate has dropped by fifty percent. Figures 5, 6 and 7 show the age-specific fertility rates from 1975 to 1987. Figure 8 is a bar chart that compares the difference between 1960 and 1987.

The following shows the age-specific (ages 15-44) fertility rates by selected county (See Table 25):

TOP FIVE	RATE*	LOWEST FIVE	RATE*
LaGrange	86.8	Monroe	36.7
Adams	83.0	Delaware	45.4
Noble	70.7	Putnam	48.2
Elkhart	70.4	Jasper	48.6

Adams	13.4
LaGrange	9.8
Union	9.1
Jay	7.2
Wabash	6.8

*Per 1,000 Women Age 40-44

There were fifteen counties that did not have any births occurring to women ages 40-44.

Source: Indiana State Board of Health, Public Health Statistics Division, 1990.

TEENAGE MOTHERS

In 1987, Indiana had 10,782 teenage mothers (women under the age of 20) who gave birth, which represents 13.7 percent of all births. This was a decrease from 1986 which had 11,115 births to teenage mothers or 14.0 percent of all births The percent decrease was mainly due to the decreased number of live births, from 79,269 in 1986 to 78,515 in 1987.

The following table shows the percent of all births to teenage mothers by selected counties:

TOP FIVE	PERCENT	LOWEST FIVE	PERCENT
Fayette	25.1	Hamilton	5.2
Scott	20.4	Union	5.9
Grant	18.7	Benton	6.3
Wayne	18.1	Dubois	7.6
Ohio	17.9	Boone	8.0

Source: Indiana State Board of Health, Public Health Statistics, 1990.

Appendix A contains population tables and figures; Appendix B contains a glossary of terms.

Additional data by age and race of mother are included on Table 5, 26, 26A, 26B, 27, 27A, 27B, and 28.

* Natural Increase: Births minus Deaths
** Per 1,000 Population
*** Births per 1,000 Women 15-44 (Adjusted to 1980 Population)
**** Total Fertility rate equals the average number of births each female would have in her lifetime if the age specific fertility rates for a given year prevailed for her entire fertile period. A rate of 2.1 is necessary to maintain a stable population.

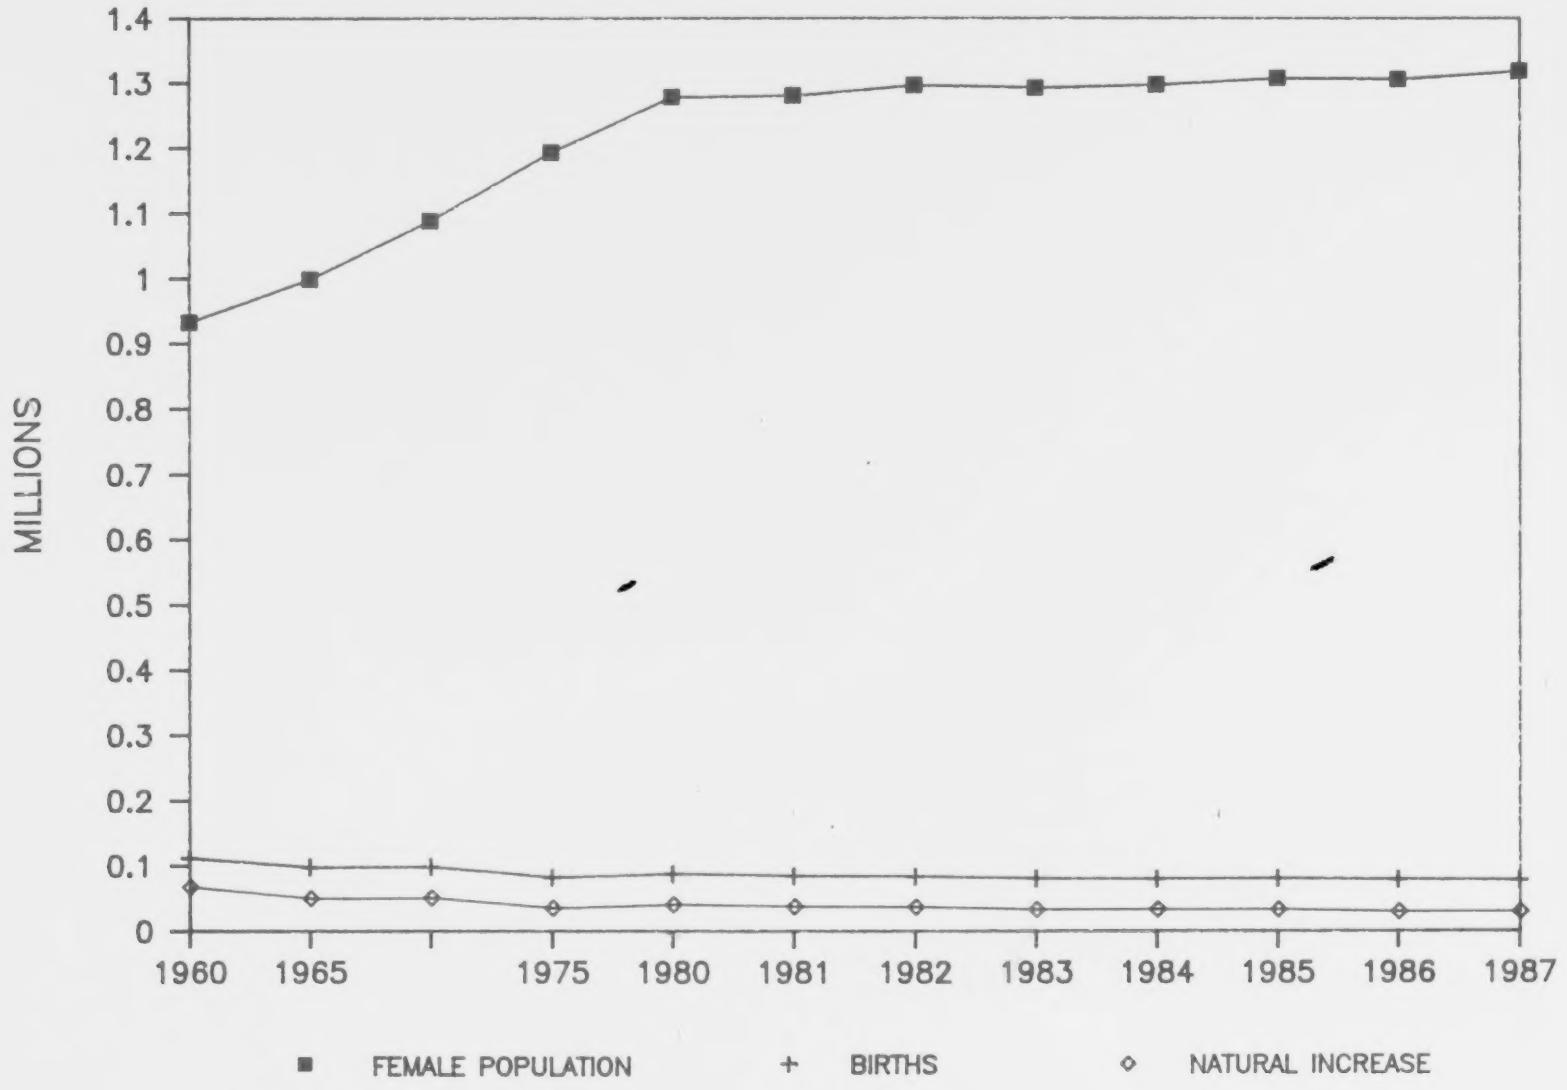
FEMALE POPULATION, BIRTHS, & NATURAL INCREASE, INDIANA, 1960 – 1987



Source: ISBH–Public Health Statistics

Appendix B

DATA SOURCES, LIMITATIONS AND DEFINITIONS

SOURCES OF DATA

Information on births, deaths, fetal deaths, and marriages is compiled from the original documents filed in the Vital Records Section and from transcripts of original certificates filed in other states but affecting Indiana residents. This report includes all 1987 births, for records received before April 15, 1988, and excludes certificates and transcripts received after that date. Because the number of 1987 vital events which are not included is small, the figures shown are relatively complete counts and are considered satisfactory as descriptive statistics.

POPULATION

Population estimates were prepared by the Indiana University School of Business and the U.S. Census Bureau.

RELIABILITY OF RATES

Many of the rates shown in this report are based on a small population, a small number of events, or both. The rates based on small numbers may be questionable due to chance factors and should be used with caution. Rates for counties with small populations also may vary considerably from year to year. In addition, one must make allowances for differences in age distributions, etc., when rates are not adjusted. Caution must be exercised when forming conclusions on the basis of crude or non-adjusted rates.

DEFINITIONS

Occurrence - Place where the event actually occurred.

Residence - Usual place of residence for person to whom event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

Births

Total Births - Total live births.

Live Birth - The complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy which, after such expulsion or extraction, breathes or shows any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached.

Birth Weight - Weight of fetus or infant at time of delivery.

Low-Weight Birth - Birth wherein the birth weight is equivalent to less than 2,500 grams.

Weeks of Gestation - The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

Plurality - The number of siblings born as a result of this pregnancy.

Birth Rates

Birth Rate - Number of live births per 1,000 population.

Age Specific Birth Rate - Number of live births to women in specific age group per 1,000 estimated female population in that age group.

Low-Weight Birth Rate - Number of live births weighing less than 2,500 grams (5lbs,8ozs) per 1,000 live births.

General Fertility Rate - Total number of live births per 1,000 women of child bearing age (15-44 years).

Total Fertility Rate - The sum of each age-specific live birth rate multiplied by the number of years in the age group.
